

Inductive Thinking

Let students build categories and relationships from data before settling on labels or generalizations.

FOCUS / DATA SET

NAME

1. FORM CONCEPTS

List or examine the data. Group items by shared attributes. Only then develop labels for the groups.

2. INTERPRET

Look for relationships among the groups. Explain patterns, compare groups, and make reasonable inferences.

3. APPLY / GENERALIZE

Use the emerging relationships to predict, test, explain, transfer, or examine exceptions and fallacies.
